\*Bachelor, can also be a Master project work!

Universität  
Siegen

## Just-in-time adaptive interventions app

For OCD interventions in a Wizard-of-Oz style feasibility study.

**Motivation:** Part of OCD treatment: Interventions by Psychologists

**Work:**

- Creation of an app (Wear OS) to deliver different types of interventions, e.g. for hand washing.  
E.g. "Stop" or an exercise (ERP micro task), with sounds, vibration, UI etc.
- Companion app on smartphone to control experiment and collect data
- Evaluation of app with users in simulated experiments (not "real" patients)
- Apps should be open-sourced, freely licensed

**Your background:**

- Android programming experience is a plus (or willingness to learn needed!)
- Willingness to recruit and record participants
- Interest for mental health and psychology/ behavioral therapy

⇒ Optimal outcome: Submission of a workshop paper in July 2026

## Enabling Trustworthy Collaborative Learning Systems for Human Activity Recognition

- Development of ML systems for the HAR domain by taking GDPR measures.
- Enhancing Federated Learning considering the characteristic of the target application.
- Evaluating metrics of designed system with existing learning systems using wearable device data.

# Thesis Topic

## Indoor Environmental Intelligence for Reliable LoRaWAN IoT Networks

### Description:

The aim is to explore how environmental office conditions (such as carbon dioxide, humidity and temperature, or even time of the day) affect an IoT network's performance by:

- An analysis of a large-scale indoor LoRaWAN dataset [1], to uncover hidden correlations between environmental factors and wireless signal parameters reliability.
- Design of machine learning (ML) models to predict signal degradation and optimize network parameters in real-time.

**Skills:** An intersection of IoT skills with data science/ML, and/or embedded systems. Python programming is highly encouraged.

# Thesis Topic

## Multi-Protocol IoT Network for Indoor Localization Using BLE, Thread, and LoRaWAN

### Description:

- Develop a hybrid **BLE/Thread - LoRaWAN** network for **precise indoor localization** in smart buildings.
- **Application Examples:** asset tracking, personnel monitoring, and indoor navigation.
- The system will leverage **BLE's fine-grained positioning** with **LoRaWAN's long-range efficiency** to provide **real-time tracking** while optimizing power consumption.

### Key Tasks:

- Develop a BLE/Thread-LoRaWAN hybrid localization system using the existing LoRaWAN setup.
- Implement and optimize ML-based RSSI fingerprinting with sensor fusion for improved accuracy.
- Design an adaptive transmission strategy to balance localization precision and power efficiency.

**Skills:** Understanding of BLE/Thread/LoRaWAN, basics in ML for HAR and localization, and proficiency in Python/C++ for IoT firmware development; Willingness to carry out research.

## Morphology-based Collaborative Self-Supervised Learning for Multi-Sensor Wearable Activity Recognition

- Collaborative capabilities of sensors in self-supervised wearable activity recognition have been shown [1]
- Goal of Thesis:** extend existing framework in [1] using statistical and deep learning based similarity metrics to determine collaborating sensors

Ubiquitous  
Computing

## Towards A Medical-Grade Long-Term Activity Sensing Widget

- Develop an embedded Widget that fits in just a few kilobytes and operates in the Bangle open-source smartwatch ecosystem
- Design lossless compression & capture algorithms to acquire and save accurately-timed sensor data from motion and heart rate sensors
- Test your setup on a custom testbench

# Thesis Topic

## An Open-Source & Realtime Embedded Eye-Tracker

- Development of a Python and OpenCV-based wearable system on a Raspberry Pi
- Based on our existing pupil detection system
- Evaluation with two existing state-of-the-art eye tracking systems

More information in H-A8110  
[kvl@eti.uni-siegen.de](mailto:kvl@eti.uni-siegen.de)

## A Wearable Stairs vs. Elevator Detector

- Using the internal barometric pressure and inertial sensor data from the Bangle.js.v2 watch, to detect when the wearer uses the stairs or lift
- Development of an efficient embedded algorithm in the Espruino IDE, an embedded open-source ecosystem to enable long-term operation
- Goal should be to deploy and validate the algorithms in a longitudinal deployment study of several weeks and users

Siegen

## Updating the process to record entry's of the WEAR Dataset

- Implementing Bluetooth synchronisation
- Implementing approximation saving
- Creating a more user-friendly way to convert data
- Compare recording between old and new method

## Improvement of workflow and usability of ChronoVault

- Develop a workflow to label Data easier in the wild
- Improve the way to copy data from ChronoVault
- Make it easier to configure the recording (Resolution, Rotation,...)
- Goal: People outside of CS should be able to use ChronoVault

[michael.brilka@uni-siegen.de](mailto:michael.brilka@uni-siegen.de)

## How attentive are passengers on Public transport

- Activities on public transport are encouraged, though how efficient is it?
- Combine a Bangle with Esense
- Measure interruptions of tasks and compare it to other places (e.g. Office)
